Introduction

Dapr

Dapr Community Feedback

*Frankly, our whole team loves Dapr. This is the
backbone of our services.*

DEVELOPER, LARGE SERVICES CO.

“

*Dapr doesn't have a lot of expense at the
beginning, and there is a lot of payback.*

DEVOPS ENGR. LARGE FINANCIAL SERVICES CO.

“

Dapr Community Feedback

What do you dislike about Dapr?

Debugging/troubleshooting is hard

Importance of Error Standardization

The Importance of Error Standardization

Richer Error Model

Richer Error Model

```
package google.rpc;

// The `Status` type defines a logical error model that is suitable for
// different programming environments, including REST APIs and RPC APIs.
message Status {
    // A simple error code that can be easily handled by the client. The
    // actual error code is defined by `google.rpc.Code`.
    int32 code = 1;

    // A developer-facing human-readable error message in English. It should
    // both explain the error and offer an actionable resolution to it.
    string message = 2;

    // Additional error information that the client code can use to handle
    // the error, such as retry info or a help link.
    repeated google.protobuf.Any details = 3;
}
```

Error Details

- `ErrorInfo` (required)
- `RetryInfo`
- `DebugInfo`
- `QuotaFailure`
- `PreconditionFailure`
- `BadRequest`
- `RequestInfo`
- `ResourceInfo`
- `Help`
- `LocalizedMessage`
- `QuotaFailure_Violation`
- `PreconditionFailure_Violation`
- `BadRequest_FieldViolation`
- `Help_Link`

Error Detail

- **ErrorInfo** (required)

Error Detail

- **ErrorInfo** (required)

ErrorInfo:

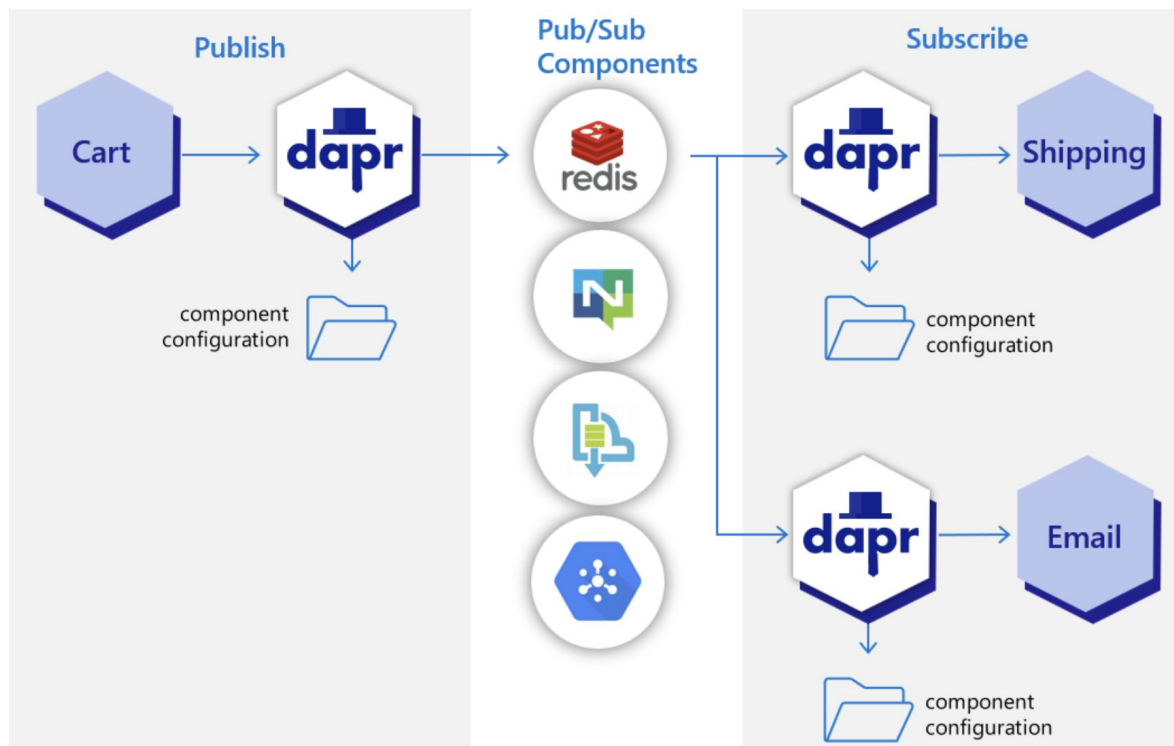

- Domain: dapr.io
- Reason: <reason>
- Metadata: <metadata>

Enriched Errors Before & After

PubSub API Overview

Before Enriched Error for PubSub API

```
$ grpcurl -H 'dapr-app-id: sub' -d '{"pubsub_name":"fakeKafka",  
"topic":"fakeTopic"}' -plaintext localhost:57534  
dapr.proto.runtime.v1.Dapr.PublishEvent
```

ERROR:

Code: InvalidArgument

Message: pubsub **fakeKafka not found**

After Enriched Error for PubSub API

ERROR:

Code: InvalidArgument

Message: pubsub fakeKafka is not found

Details:

```
1) {  
  "@type": "type.googleapis.com/google.rpc.ErrorInfo",  
  "domain": "dapr.io",  
  "reason": "DAPR_PUBSUB_NOT_FOUND",  
}  
2) {  
  "@type": "type.googleapis.com/google.rpc.ResourceInfo",  
  "description": "pubsub fakeKafka is not found",  
  "resourceName": "fakeKafka",  
  "resourceType": "pubsub"  
}
```

Expanded Enrichment

Details:

```
1) {  
  "@type": "type.googleapis.com/google.rpc.HelpLink",  
  "url":  
    "https://docs.dapr.io/developing-applications/building-blocks/pubsub/pubsub-overview",  
  "description": "Dapr docs pubsub overview",  
}
```

Error Details

- `ErrorInfo` (required)
- `RetryInfo`
- `DebugInfo`
- `QuotaFailure`
- `PreconditionFailure`
- `BadRequest`
- `RequestInfo`
- `ResourceInfo`
- `Help`
- `LocalizedMessage`
- `QuotaFailure_Violation`
- `PreconditionFailure_Violation`
- `BadRequest_FieldViolation`
- `Help_Link`

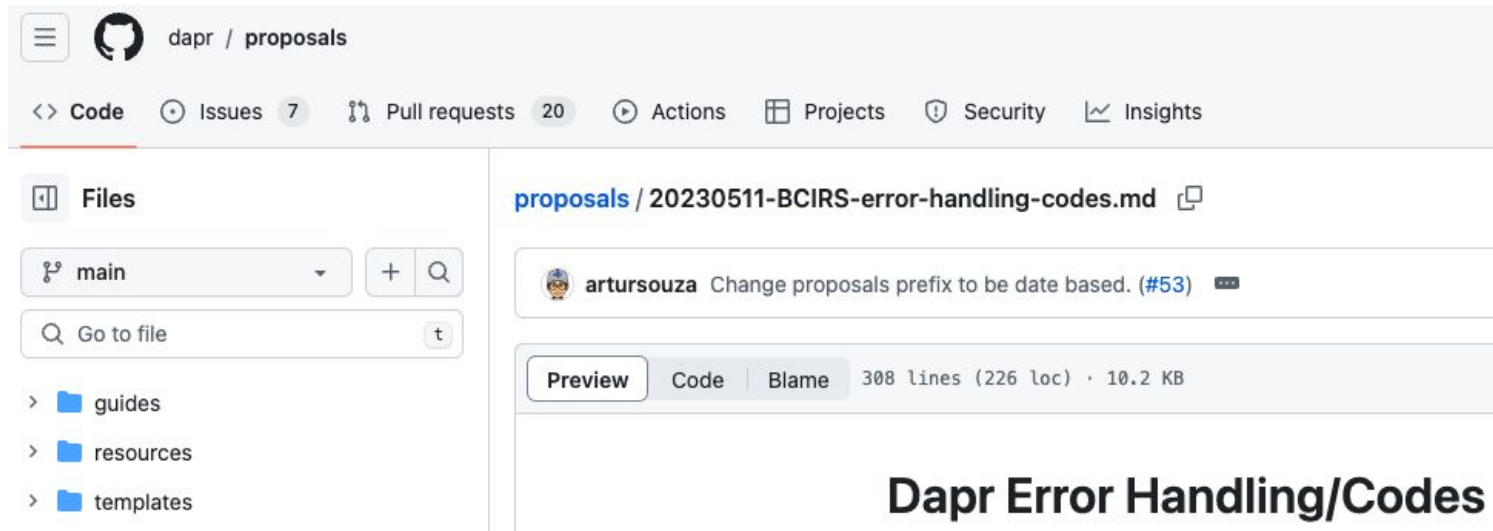

Errors pkg in the dapr/kit repo

Errors pkg in the dapr/kit repo

- Builder Pattern
- Error immutable
- Backwards compatibility
- Based off the dapr/proposals

Consumption of the Errors pkg

Consumption of the Errors pkg

```
err := errors.NewBuilder(grpcCode, httpCode, msg, tag)
```

```
return err.WithErrorInfo(  
    errors.CodePrefixPubSub+errCode,  
    p.metadata,  
).Build()
```

Implementation Details

Implementation Details of the Errors pkg

```
type Error struct {  
    details []proto.Message  
    grpcCode grpcCodes.Code  
    httpCode int  
    message string  
    tag string  
}
```

```
type ErrorBuilder struct {  
    err Error  
}
```

Implementation Details of the Errors pkg

```
func NewBuilder(grpcCode grpcCodes.Code, httpCode int, message string, tag
string) *ErrorBuilder {
    return &ErrorBuilder{
        err: Error{
            details: make([]proto.Message, 0),
            grpcCode: grpcCode,
            httpCode: httpCode,
            message: message,
            tag: tag,
        },
    }
}
```

Implementation Details of the Errors pkg

```
func (b *ErrorBuilder) WithErrorInfo(reason string, metadata map[string]string)
*ErrorBuilder {
    errorInfo := &errdetails.ErrorInfo{
        Domain:  Domain,
        Reason:  reason,
        Metadata: metadata,
    }
    b.err.details = append(b.err.details, errorInfo)

    return b
}
```

Implementation Details of the Errors pkg

```
func (b *ErrorBuilder) Build() error {  
    // Check for required ErrorInfo  
    containsErrorInfo := false  
    for _, detail := range b.err.details {  
        if _, ok := detail.(*errdetails.ErrorInfo); ok {  
            containsErrorInfo = true  
            break  
        }  
    }  
    if !containsErrorInfo {...}  
  
    return b.err
```

Implementation Details of the Errors pkg

```
func (b *ErrorBuilder) Build() error {  
    // Check for required ErrorInfo  
    containsErrorInfo := false  
    for _, detail := range b.err.details {  
        if _, ok := detail.(*errdetails.ErrorInfo); ok {  
            containsErrorInfo = true  
            break  
        }  
    }  
    if !containsErrorInfo {...}  
  
    return b.err
```
